Split Voice System — What to Explain

For: the presenter
Use with: the 6 slides from **VOICE_PPT_BRIEF.pdf**

> **Remember this line:**
> Whisper hears the patient → AI plans the next booking step → Python checks the hospital database → WhatsApp replies with text/buttons.

Slide 1 — Open

> Say: "We added voice support. Patients can send a WhatsApp voice note instead of typing, and the bot continues the same booking flow."

Slide 2 — Patient experience

> Say: "There is no special app. The patient uses WhatsApp voice notes. The bot does not speak back — it replies with normal text and buttons, exactly like typed chat."

- Voice = another way to input
- Not a separate product
- No TTS / robot voice out

Slide 3 — Split idea (main point)

> Say: "We split the system into two parts. The AI planner understands what the patient said and how far we can jump in booking. The executor is normal code — it checks real doctors and real free times in the database. The AI never books alone."

Planner (AI)	Executor (System)
Understands speech transcript	Checks hospital DB
Extracts doctor / day / time	Holds slot or asks next question
Chooses next booking step	Sends WhatsApp reply
Can be aggressive	Must be careful / truthful

Slide 4 — Flowchart

> Say: "Voice note comes in. Whisper turns it into text. GPT makes a plan. Our system validates that plan against the database, then continues booking."

```
1. WhatsApp voice note
2. Speech-to-text (Whisper)
3. AI creates a plan (goal + next step + slots)
4. System validates against hospital data
5. Reply on WhatsApp (text / buttons)
```

Slide 5 — Example

> Say: "Patient says: I want Dr Ahmed Friday at 2. AI plans to hold that slot. System checks: doctor exists, Friday is valid, is 2pm free? If yes, hold and ask confirm. If no, show other times and explain. We never invent an appointment."

Key word: fallback — if the exact time fails, move one step back safely.

Slide 6 — Close

> Say: "So voice makes booking easier, supports Arabic and English, and stays safe because hospital data is always the source of truth."

If someone asks

Question	Short answer
Do you reply with voice?	No — WhatsApp text and buttons only.
What converts speech?	Whisper speech-to-text.
Who decides the next step?	AI suggests · system confirms with DB.
Can AI invent a doctor/time?	No. Executor validates everything.
Arabic support?	Yes — Egyptian Arabic and English.
Is voice a separate bot?	No — same booking flow as typing.

30-second version

> "Patients can book by WhatsApp voice note. Speech becomes text, AI plans the booking step, and our system checks the real hospital schedule before replying with normal buttons. Safe, simple, same product as typed chat."
